# What is Farm Biosecurity?

## Why should you care about it?

- Biosecurity on the farm is the everyday practices in place to prevent or reduce the introduction of diseases and pests.
- It is a whole farm approach for assessing and ranking the risks to livestock herd and flock health.
- People, animals, equipment and vehicles can bring infectious diseases to a farm, or carry diseases away to another farm. It is important to do everything you can to reduce the risks.

**Biosecurity is not just for farmers. It is for anyone who raises livestock.**

Visit the Healthy Farms Healthy Agriculture website for tutorials, educational videos, planning tools and more. Build a plan and practice biosecurity to protect livestock health, and human health too.
