Postharvest Storage
A Workshop for Producers and Processors

Chris Callahan
UVM Extension Agricultural Engineering
1 Scale Ave, Suite 55
Rutland, VT 05701
chris.callahan@uvm.edu
blog.uvm.edu/cwcallah
802-773-3349

www.sare.org
Project ONE13-176
Workshop Outline

• Importance of Food Storage
• Storage Characteristics of Food
• Energy and Heat Transfer
• Components of a Storage System
• Sizing and Design
• Practice Session
Summary

1. Know your target conditions.
2. Provide multiple zones.  
   *May not be multiple rooms.*
3. Informed design, construction and purchase of equipment.
4. Measure your actual conditions.
5. Improve crop selection on the way in.
Workshop Outline

• Importance of Food Storage
• Storage Characteristics of Food
• Energy and Heat Transfer
• Components of a Storage System
• Practice Session
Introductions

- You and your farm or business.
- Why is Food Storage Important to you?
- What do you hope to learn from the workshop?
- What have been some of your challenges with storage?
- Do you have any specific storage practices you’d like to share?
Importance of Food Storage

• Product quality preservation
• Food safety
• Harvesting & season flexibility
• Food security
• Sunk costs in product
• Market expansion & extension
Market Access & Economics

• Competitive advantage
  – Market for produce in winter is less saturated

• 2010-2011 winter markets increased 38%
  – 886 in 2010, 1,225 in 2011

• Brattleboro’s winter market
  – 18 vendors in 2006, 32 vendors in 2011

• Winter marketing opportunities abound but there is competition
  – Quality is a differentiator
Workshop Outline

• Importance of Food Storage
• Storage Characteristics of Food
• Energy and Heat Transfer
• Components of a Storage System
• Practice Session
FRESH PRODUCE

- Is alive
- Breathes
- Releases heat
- Loses moisture
- Can even die
- Can get sick

From Gordon Mitchell, UC Davis
Respiration
• Crops continue to respire and metabolize post-harvest
  – Through respiration crops use oxygen to break down energy (carbohydrates, fats or proteins)
• Respiration rates of different crops varies:
  – Low rate: Apples, Potatoes
  – Moderate: Carrots, Cabbage
  – High rate: Sweet Corn, Winter Squash
Respiration

• Respiration leads to:
  – Drying out
  – Decreased food value of crops
  – Less sweetness
  – Less dry weight
  – Creates heat
  – Decreased shelf life, quality & value

• Good news!
  – Respiration & metabolism can be managed
Temperature

• Respiration & Metabolism are highly dependent on temperature.
• By managing temperature you can manage respiration
Temperature

• General rule:
  – 32-35°F / 0-2°C for cool season crops,
  – 47-55°F / 8-13°C for warm season crops
  – Varies by crop.

• Beware of:
  – Freezing Injury
  – Chilling Injury
Humidity

• Relative Humidity (RH)
  – Amount of moisture in the air at a given temperature
  – Temperature dependent
    • Warmer air holds more moisture

• Transpiration
  • Crops release moisture into air through respiration

• Manage transpiration by managing RH
Ethylene

• C2H4
• Ripening hormone
• Produced in stored produce (at various rates)
  – plant hormone
  – physiologically active at very low concentrations
    • (0.1 to 10ppm)
Ethylene Scrubber

• Absorbs Ethylene from the air
• Like an air filter for dust, etc.

Recap - What do we mean by “Conditions”?

• Temperature
• Humidity
• Ethylene / Ventilation
Pathology

- Control begins with seeds, field, harvest, washing and packing.
- Conditions do not improve in storage.
- Take care in proper curing if applicable and maintaining proper storage temps & RH.
- Avoid direct soil contact in storage.
And each crop is different

- Recommended storage conditions
  - Temperature
  - Relative humidity
- Ethylene production rate
- Ethylene sensitivity
- Chilling/Freezing Injury
- Variety differences

http://www.ba.ars.usda.gov/hb66
Breakout

• Pick a crop
  – Potato
  – Beet
  – Carrot
  – Onion
  – Cabbage
  – Winter Squash
  – Garlic
  – Sweet Potato

• Read through Handbook 66 chapter on your crop.

• Report out to the group on your findings.
Workshop Outline

• Importance of Food Storage
• Storage Characteristics of Food
• Energy and Heat Transfer
• Components of a Storage System
• Practice Session
Energy in Food Storage

- Food storage and quality preservation depend on maintaining
  - Temperature
  - Humidity
- Against ambient conditions that differ from the target conditions and which change
- Generally cooling, but may be heating as well.
Energy Basics

• **Energy**: The ability to do work.
  – Can be stored or converted
  – Cannot be created or destroyed
  – Units: kWhr, BTU, Joules, Calories, Cord, Gallons

• **Power**: Energy converted over time.
  – Instantaneous measure
  – Never 100% efficient
  – Units: kW, BTU/hr, Joules/second, Calories/day, Horsepower
Heat Transfer

• Heat will naturally flow from hot to cold (seeking equilibrium and the “lowest energy state”).

• This is a blessing and a curse
  – We benefit from this in heating and cooling applications (think furnaces or evaporators)
  – We fight it when trying to keep a greenhouse warm in early spring or a cooler cool in mid summer.
Heat Transfer

• Three modes
  – Conduction – through solids
  – Convection – through fluids (liquid or gas)
  – Radiation – directly from one body to another

• All are proportional to temperature difference

• ...and differ by how the heat flow is slowed (or enhanced.)
Conduction

Hot (caffeinated) liquid.

Fingers

Ceramic wall
Convection

There is also phase change here.

Hot (caffeinated) liquid.

Breath

Fingers
Photo Credit: Paul Sumner. Via UGA.
http://www.caes.uga.edu/Publications/pubDetail.cfm?pk_id=7954
No, not the marshmallow!

The heat you feel directly from the fire or from the sun.
Heat Transfer

• The way we try to limit heat transfer in food storage is with insulation and sealing.
  – Insulation – retards heat flow through walls
  – Sealing – retards air flow and infiltration between separated spaces

• The ways we try to support heat transfer is with immersion and air flow.
Insulation

• The rate of heat transfer is proportional to the temperature difference and the overall heat transfer coefficient.

• Overall heat transfer coefficient (“U”) captures how easily heat moves from one body or fluid to another.
  – Conduction – through solids
  – Convection – through fluids
  – Radiation – body to body
What Does R-Value Tell Us?

• The Rate of Heat Loss / Gain = Surface Area times Temperature Difference all divided by R-Value

\[
Q = \frac{\text{Area} \times (\text{Tout} - \text{Tin})}{\text{R-value}} \text{ BTU/hr}
\]
Breakout

• Think about some place where you have an insulated wall or floor or a wall you hope is insulating something.

• List the materials
  – Inside wall surface
  – Cavity material
  – Outside wall surface
  – Etc
Breakout

• Use handouts to find the R value for each layer of your wall or floor.

• Add them up, multiplying where needed by the thickness.
  – Some are based on “per inch thickness”
  – Some are based on fixed thicknesses.

• Look at the units of measure
  – hr*ft2*F/BTU or hr*m2*C/J
Vinyl dairy board (FRP) = 0.00
½" Plywood = 0.63
8" Blueboard
(Expanded Polystyrene) = 32.00
½" Plywood = 0.63
Clapboard Siding = 0.80

Overall R Value 34.06
(hr-F-ft2/BTU)

Neglecting heat transfer through studs
Consider Slab Insulation

- Comparing conduction only.
- High R value = Low U value = less heat flow

\[ U = \frac{1}{R} \]

\[ U = \frac{1}{0.32} = 3.1 \]  

50 times less heat gain with 4” of blueboard under slab (per square foot of floor).
Cooler Insulation

• A very common question is, “How much insulation should I put in my cooler?”
• Let’s take a look at a 10’x20’x8’ cooler.
• Assume 90 F (32 C) air and 50 F (10 C) ground
• Assume 34 F (1 C) cooler temp (6 months of use)
• Framed and insulated by grower
• Walls have 4” blueboard insulation.
  – R16 walls, 4 (hr-ft2-F)/BTU per inch
• Compare 4” slab insulation to no insulation.
**Cooler Insulation**

- Roughly *16 times* the energy use with no slab insulation. This accounts for wall and ceiling losses as well.

<table>
<thead>
<tr>
<th></th>
<th>With Slab Insulation</th>
<th>Without Slab Insulation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Peak Loss / Evaporator Sizing</td>
<td>2,580</td>
<td>12,380 BTU/hr</td>
</tr>
<tr>
<td>Peak Loss / Compressor Sizing</td>
<td>0.3</td>
<td>1.7 HP</td>
</tr>
<tr>
<td>Electricity Use (6 months)</td>
<td>288</td>
<td>4,522 kW/hr/yr</td>
</tr>
<tr>
<td>Operating Costs (6 months)</td>
<td>43</td>
<td>678 $/yr</td>
</tr>
</tbody>
</table>
Cooler Insulation

- Insulation costs about $0.70 per inch thickness per square foot.
- 4” slab insulation would cost $560 for this cooler
- Our annual savings would be $635.
- Payback <1 year of operation.
- You can insulate above a slab as well, so retrofit is possible.
Cooler Insulation

• What if everything was the same except wall & ceiling insulation thickness?

• 2”, 4” and 6” insulation in walls:

<table>
<thead>
<tr>
<th></th>
<th>With 2 inch wall insulation R8</th>
<th>With 4 inch wall insulation R16</th>
<th>With 6 inch wall insulation R24</th>
</tr>
</thead>
<tbody>
<tr>
<td>Peak Loss / Evaporator Sizing</td>
<td>4,960</td>
<td>2,580</td>
<td>1,787</td>
</tr>
<tr>
<td>Peak Loss / Compressor Sizing</td>
<td>0.7</td>
<td>0.3</td>
<td>0.2</td>
</tr>
<tr>
<td>Electricity Use (6 months)</td>
<td>1,041</td>
<td>564</td>
<td>405</td>
</tr>
<tr>
<td>Operating Costs (6 months)</td>
<td>156</td>
<td>85</td>
<td>61</td>
</tr>
</tbody>
</table>
Breakout

• Why is slab insulation so significant?
Why Slab Insulation Has Such an Impact.

- Ground temperature lags air temperature seasonally.
- It is highest right when most growers are seeking long-term storage.
- And stays higher than desired storage temperature.
- Always a load.
Elliston root cellar, photo credited to http://donjarrl.blogspot.com/2009_07_01_archive.html
Root Cellar

10’ W x 10’ L x 8’ H
Simplifying assumption:
Assume average soil thickness on sides is 1.4 x 50% of the cellar height. = 5.6 ft

Soil R = 5-10 per foot of thickness
Root Cellar

- Outside Temperature: -25 C / -13 F
- Inside Temperature: 2 C / 36 F

Some other assumptions:
- 2/3 of volume is taken up by crop (22,500 lbs)
- Crop is potatoes (110 BTU/ton/hr)
- Neglecting the door
- Assuming a tight construction (no air exchange)
Heat gains and losses...

• Heat Gains
  – Product $+1238$ BTU/hr
  – Floor $+270$ BTU/hr

• Heat Loss
  – Roof $-490$ BTU/hr
  – Soil Berm $-407$ BTU/hr
  – Front Wall/Door $-161$ BTU/hr

• Surplus Heat $435$ BTU/hr
  (127 Watts)
That’s a lot of potatoes

• What if we were only 10% full
• 3,360 lbs or 1,520 kg of potatoes
• 185 BTU/hr or 54 Watts from product
• Net heat needed is 619 BTU/hr or 181 Watts
• A small space heater on a thermostat.
Same song; different verse...

• Heat Gains
  – Product +185 BTU/hr
  – Floor +270 BTU/hr

• Heat Loss
  – Roof -490 BTU/hr
  – Soil Berm -407 BTU/hr
  – Front Wall/Door -161 BTU/hr

• Heat Addition Needed 619 BTU/hr
  (181 Watts)
Energy & Heat Transfer

• Introductory Thermodynamics
  – Matter & Temperature
  – Intro to Psychrometrics—Humidifying & Drying
    • The “Triple Point”
    • Water’s Phase Change Properties
    • Adding Humidity to a Potato Room

• Heat Transfer Modes
What is happening here?
Humidifying and Drying

• What is actually happening?

• Depends on water changing “phase”
  – Liquid
  – Vapor

• That requires air, energy flow, and temperature
Water’s Phase Change

• What do we know about the freezing and boiling point of water?
• What we think we know…
  – Water freezes at 32 F and 0 C
  – Water boils at 212 F and 100 C
• It is true….but…
• Only at standard atmospheric pressure!
• How is there water vapor in air?
Sorry... it's a bit more complicated

This ain't bad either.

This. Right here. Is one of the most beautiful things in the universe.

And, what the heck is going on here?
Water and Air Mixtures

• When water vapor is in air, it behaves as though it is at a “partial pressure” or lower pressure than atmospheric.
• Meaning, it is vapor even though it isn’t at 212 F.
• This allows for “humidity” below 212 F.
  – And most of the weather systems we deal with.
Relative Humidity

• The degree to which air is “saturated” with water vapor at a certain temperature and barometric pressure.

• Since barometric pressure is relatively constant, RH is really a function of temperature.
  – For most agricultural applications
  – Pressure’s influence is the basis of vacuum cooling, however…
Water and Air Mixtures
• We don't actually measure Relative Humidity (RH)
• We measure
  – Dry Bulb Temperature, and
  – Wet Bulb Temperature
• RH is a calculation based on these two temperatures.
Psychrometric Charts

• Relate Dry Bulb T, Wet Bulb T and RH.

The problem with relative humidity is that it is relative.
Psychrometric Charts
Psychrometric Calculator

The Sugar Engineers

Psychrometric Calculations

The formulations used here to calculate moist air properties are based on perfect gas relations published in 1989 ASHRAE Fundamentals Handbook, which should be accurate. Nevertheless, it is strongly recommended that you compare the results calculated by this worksheet with a psychrometric chart. There is no error checking so you should use reasonable input values.

Workshop Outline

• Importance of Food Storage
• Storage Characteristics of Food
• Energy and Heat Transfer
• Components of a Storage System
• Practice Session
Structure and Materials

- Sound
- Durable
- Moisture tolerance
- Reusable?
- Portable?
Alternatives

• Overseas shipping container
• Refrigerated tractor-trailer
Structure and Materials

“Smooth and cleanable”

Galvalum roofing

Lauan (1/8” underlayment, top coat with paint)

Fiber reinforced plastic (FRP, “dairy board”)
Structure and Materials

Practices to avoid

Direct soil contact

Uncoated plywood / chipboard / sheetrock

Uncoated sprayfoam
Framing

• Beware of thermal conductors & thermal bridges
  – Staggered stud walls are an option
• Framing with metal vs. wood
  – Must be structurally sound
• Buying a prefabricated box (e.g. pre-fab shed)
## Materials

- **Interior materials should be:**
  - smooth;
  - impervious;
  - free of cracks and crevices;
  - nonporous;
  - nonabsorbent;
  - non-contaminating;
  - non-reactive;
  - corrosion resistant;
  - durable and maintenance free;
  - nontoxic;
  - easily cleanable.
Materials

• Examples of good materials to use for interiors:
  – Fiberglass Reinforced Plastic (FRP) (dairy board)
  – Luon (sealed or painted)
  – Sheet Metal
  – Recycled metal roofing or vinyl siding materials

• What not to use
  – Uncoated wood
  – Unsealed spray foam
Avoid Bare Wood & Liquid Water
Options for Insulation

• Pre-Fabricated Box or Individual Panels
• Structural Insulated Panels
• Homemade panels
• Rigid insulation board
• Cellulose Insulation
• Spray Foam
• Other options:
  – Overseas Shipping Containers
  – Refrigerated Tractor-Trailer
Pre-Fabricated Box

Federal Regulations require R-25 for cooler walls and ceilings for prefab box

– Advantages
  • Essentially a plug & go model
  • Easiest to install
  • Potentially moveable
  • Can find used

– Disadvantages
  • Most costly
  • May not be able to find a prefabricated box that perfectly meets specifications
  • Not custom-adapted
Structural Insulated Panels

- Pre-fabricated insulated panels that can be used for cooler siding
- Can be load-bearing
- Can be used for roof-insulation
- Make sure food-safe materials are used
Homemade Panels

• Mimic structural insulated panels in construction
  – Foam board sandwiched between exterior building materials
  – R-value is dependent on what you create
  – Higher labor costs
  – Build it tight
Staggered Stud Walls
Rigid Insulation Boards

- “Blue board”
  - Polystyrene
  - R 4/inch
  - $0.62 /ft^2-inch thickness

- Tuff-R
  - Polyisocyanurate
  - R 6.5/inch
  - $0.66 /ft^2-inch thickness
Cellulose Insulation

- Inexpensive, recycled materials
- High R-value
  - 3.8 /inch
- Moisture management is essential
Fiberglass Insulation

- Questionable sustainability
- R 3.1-4.3/inch
- Not recommended for cooler applications due to moisture issues.
Spray Foam

• Polyurethane spray foam
  – Creates a tight seal, is versatile & inexpensive
  – High-density foam is best
  – Can create r-value of 50 or higher
    • 6.25 per inch of insulation
  – Not smooth or cleanable
  – Flammability
  – Sealing spray foam
    • Make sure it can withstand cooler conditions.
    • Ames Rubber – has worked for several growers
Drainage

• Lots of moisture collects on the floors in coolers
  – Build entire cooler slanted towards the door (or drain)
  – Incorporate a drain into the cooler

• Route condensation line intentionally.
Lighting

• Shatter-proof, shatter-resistant, or with a protective guard
• Must work in low temps/high humidity and turn on quickly
  – Compact fluorescent bulbs aren’t great
• Should be bright enough to be able to see
  – think efficiency!
Access: Doors and Sealing

• Doors
  – Home built or pre-fabricated?
  – Must seal-up tight! Hard to perfect
• Swing vs. Sliding vs. Overhead
• Plastic Curtains
• Weather Stripping
• Caulking / Silicone at Wall Seams

Sliding cooler door with plastic curtains at Jericho Settlers Farm
Doors and Sealing

• Check door seals and latches - adjustable
Structure and Materials

• Sealing –
  – daylight test
  – (or dog/cat test).
Containers

- Storage bins/pallet sizing
- Consider: Wood vs. Plastic, Maneuverability, Stackability, Airflow & circulation
Winter Wash Station

- Many farms need to incorporate wash stations into winter storage systems

- Consider:
  - Will you be washing crops going into or coming out of storage
    - Does there need to be space to wash crops indoors?
  - Is there a creative way to combine a wash station with another storage area that needs humidity? Condenser heat?
Washing

• Staining: Depends on soils types, crop variety, & maybe timing of harvest

• Disease
  – Washing can help prevent infiltration of crop disease, or it can help disease enter crop

• Storability of crop
Rodent & Pest Control

• New construction vs. Retrofit
• Bait & traps
  – OMRI approved D3 rodenticide
  – Must have strict schedule for checking traps!
• Tight envelope excludes pests
  – Wire mesh / hardware cloth
• Some storage bins help exclude rodents
• Cement curb
Good Agricultural Practices

• Examples of Requirements:
  – Storage areas are clean and free of contamination.
    • Smooth and cleanable surfaces
    • Cleaning schedule
  – Storage areas are used exclusively for food crops and their containers.
  – Produce is stored at least six inches off the floor, depending on the nature of the crop.
Managing Zones

- Innovations to incorporate multiple zones into a single space
  - Adapted packaging
- Red Fire Farm
  - Plastic wrapped pallets with wet burlap & water reservoirs
  - Consider ethylene—how long will product be in storage?
  - Watch for hot spots during storage

Innovation at Red Fire Farm
Breakout

• What have you built or what do you have planned?

• What construction details are you considering?
Paddle Check
Intro to Refrigeration

- Mechanical Refrigeration is a pumping system.
- We use the phase change of a refrigerant to move heat from one location (low temperature) to another (high temperature.)
- Yes, we are moving heat from cold to hot.

\(^1\)Calculated from Psychrometric Tables.
\(^2\)Actual airstream temperature drop between inlet and outlet. The coil TD will be approximately twice this value.

CoolBots™

• Adapt an air conditioner for use as a refrigeration system.
• Air conditioners are basically “packaged” refrigeration systems run at higher temperature.
• Build a “good box” first.
CoolBots™

• **Pro’s**
  – Low initial cost
  – Easy to retrofit into existing spaces with basic construction
  – Potential efficiency benefit

• **Con’s**
  – Slow to “pull down” temperature
  – Slow to recover from rises in temp
  – Can not freeze, only cools down to 35 ºF

[www.storeitcold.com](http://www.storeitcold.com) – Has loads of info and is very clear.
CoolBot vs. Conventional

- 2009 NYSERDA Study
- 8’x10’ storage room - Albany, NY conditions
- Cooled to 35 F
  - with evap fan controls
    - Conventional is 74 kWhr/yr more efficient ($10/yr)
  - without evap fan controls
    - CoolBot is 230 kWhr/yr more efficient ($30/yr)
- Coolbot cost $750 (net of cold room)
- Conventional cost $4,400 (net of cold room)
Root Cellars

• Air Exchange
  – Helpful for shoulder months
  – Need positive shutoff to avoid passive ventilation when not wanted
  – Double thermostat design with a small fan

• Rodent Control

• Moisture and Condensation Plan
Elliston root cellar, photo credited to http://donjarrl.blogspot.com/2009_07_01_archive.html
Heating

• Generally required for winter squash, pumpkins, etc.
• Same basic principles related to storage space / room.
• Air flow and circulation
• Heater controls
Humidification

- Generally required for root veg storage
Humidification

Trion Duct Humidifier
$285

Atomizing type
Auto-fill

6 gal per day

www.qasupplies.com

Toilet fill valve

Tank deicing heater
Humidification

Dayton – Humidifier Control 20-90%, $60

Standard room humidifier, refills are manual. $30
Drying

• Generally not an issue in storage.
• “Curing” is a method of prolonging storage life and prevent disease in storage
  – Essentially control drying
• If storage area is high RH relative to desired conditions, consider controlled outside air exchange.
Workshop Outline

• Components of a Storage System
  – Creating a Structure or Box
  – Cooling
  – Heating
  – Ventilation & Air Flow
  – Humidification & Drying
  – Controls
  – Monitoring
Controls - Thermostats

• Control a load based on temperature
Controls - Thermostats

• Dramm – Accurate to 1 degC (2 deg F)
  – Same model as greenhouse ones.
  – Single and dual stage
  – For heating and cooling
    • Different set of contactors.
Controls - Humidistats

• Control a load based on measured (or calculated) RH

• Sadly, selection is lacking. Especially for cold room conditions.

• Motivated development of the new RH sensor.
Controls – Expandable Systems

- Combined Temp and RH
- Modular and expandable
- Modulated outputs as well as On/Off
Ventilation & Airflow

- Seeking to have a well mixed storage space.
- Avoid hot spots
- Avoid high moisture & avoid over drying
- Strip ethylene.
- 3-5 volume changes per day is rule of thumb.
- Higher for curing or pre-cooling.
Controls - FreeAire™

- Uses cold outdoor air to refrigerate.
- Reduces compressor run time
- Reduces evaporator fan load
- Install involves other efficiency upgrades.
Remember that a thermostat is simply a switch.
Controls

• Never trust your thermostat or humidistat
  – Precision and accuracy are different things.

• Always have a secondary, trusted measurement
  – Sling psychrometer is best.

• Check your \textbf{actual} conditions regularly

![Accuracy and Precision Diagram]
Workshop Outline

- Components of a Storage System
  - Creating a Structure or Box
  - Cooling
  - Heating
  - Ventilation & Air Flow
  - Humidification & Drying
  - Controls
  - Monitoring
Measure and Monitor

• “The measured variable improves.”

• Temperature **AND** Relative Humidity

• Don’t assume you have the conditions you want. **Measure**.

• **Low tech** – wall sensors, daily checks, log book

• **High tech** – remote monitoring, email alerts

• Calibration and certification
USB Data Loggers

DATA-Q  www.dataq.com

EL-USB-2+ USB Data Logger
Measures ambient temperature and humidity
Higher accuracy than EL-USB-2
Automatically calculates dew point
-35 to +80 °C (-31 to +176 °F) temp measurement range
±0.3 °C (±0.6 °F) overall temp accuracy
0-100% RH measurement range
±2.0% overall RH accuracy (20-80%RH)
2 User-programmable temp alarm thresholds
2 User-programmable RH alarm thresholds

5 minute readings = 56 days storage
1 minute readings = 11 days storage
Download data to computer

$125 (RH +/-2%)
$99 (RH +/-3%)
$82 (RH +/-3%)
Infrared Thermometer

$20-100
Remote Monitoring
Remote Monitoring

- $400-$2000 for a typical install.
Sensaphone

- Several models
- 400 – 4 inputs
- 800 – 8 inputs
- $460 for the control
- $32 per sensor

Mojyle

Gateway: $300
Sensors: $30
Annual Web Fee: $300
www.mojyle.com
Apitronics

Base (Hive): $111
Sensors (Bees): $205-240

All wireless

www.apitronics.com
Summary

1. Know your target conditions.

2. Provide multiple zones.
   *May not be multiple rooms.*

3. Informed design, construction and purchase of equipment.

4. Measure your actual conditions.

5. Improve crop selection on the way in.
“The perfect is the enemy of the good.”

- Voltaire
Commodity Summaries

Fruits and Vegetables

Annual Culinary Herbs
- Apple
- Apricot
- Araz
- Artichoke
- Asian Pear
- Asparagus
- Atemoya
- Avocado
- Banana and Plantain
- Bean
- Beet
- Blackberry
- Blueberry
- Bok Choy
- Breadfruit
- Broccoli
- Brussels Sprout

Cassava
- Cauliflower
- Celeriac
- Celery
- Cherimoya
- Cherry (Sweet)
- Chicory
- Chinese Cabbage
- Coconut
- Cranberry
- Cucumber
- Currant, Gooseberry and Elderberry
- Date
- Dragon Fruit
- Durian
- Eggplant
- Endive and Escarole
- Fennel
